1. Create python script file with contents from **“pythonscript.py”** text file
    a. Vim pythonscript.py
    b. Copy contents from text file “pythonscript.py”
    c. Save pythonscript.py
    d. Chmod +x pythonscript.py
2. Run bash command to run the python script:
    a. Python3 pythonscript.py
    b. Enter values for the prompts

Please see screenshot below for Steps 1 and 2

```
carrunategui@cs:~$ vim pythonscript.py
carrunategui@cs:~$ python pythonscript.py
-bash: python: command not found
carrunategui@cs:~$ python3 pythonscript.py
Enter name: Claudia Arrunategui
Enter weight(lbs): 155
Enter height(feet only): 5
Enter height(inches only: 7
Claudia Arrunategui 's BMI is:  24
What are you doing here? You need some meat on those bones!
carrunategui@cs:~$ python3 pythonscript.py
Enter name: Claudia Arrunategui
Enter weight(lbs): 200
Enter height(feet only): 5
Enter height(inches only: 7
Claudia Arrunategui 's BMI is:  31
Good lets get started!
Enter your gender (M or F): F
Enter your age: 35
Enter your desired weight(Above 150): 155
There you go!

 Claudia Arrunategui 's recommended daily calorie intake is: 1500 calories a day
It will take you: 45 weeks to get to 155 pounds while losing 1 pound a week
carrunategui@cs:~$
```

3. Create awkProject.awk script with contents from **awkProject.awk** text file
    a. Vim awkProject.awk
    b. Chmod +x awkProject.awk
4. Run awk script as follows:
    a. ./awkProject.awk userResults.txt > awkOutput.txt
    b. Check that awkOutput.txt was created and variables were saved

Please, see screenshots below for Steps 3 and 4

```
carrunategui@cs:~$ vim awkProject.awk
carrunategui@cs:~$ ./awkProject.awk userResults.txt > awkOutput.txt
carrunategui@cs:~$ cat awkOutput.txt
Arrunategui
200
67
31
F
35
155
1500
45
carrunategui@cs:~$
```

5. Create testingPERL.pl file with contents from **testingPERL.pl** text file
    a. Vim testingPERL.pl
    b. Chmod +x testingPERL.pl
6. Run PERL script as follows:
    a. ./testingPERL.pl awkOutput.txt outputfile.html
    b. Check that outputfile.html was created and displays contents

Please, see screnshots below for Steps 3 and 4

```
carrunategui@cs:~$ vim testingPERL.pl
carrunategui@cs:~$ chmod +x testingPERL.pl
carrunategui@cs:~$ ./testingPERL.pl awkOutput.txt outputfile.html
carrunategui@cs:~$ cat outputfile.html
<!DOCTYPE html>
<html>
<head>
        <title>html</title>
</head>
<body>
        <h1>Information</h1>
        <p>
        Name: Arrunategui<br>
        Current Weight: 200 lbs<br>
        Desired Weight: 155 lbs<br>

        Weeks required to meet weight loss goal: 45<br>
        </p>
        <h1>Nutrients</h1>
        <p>
        You will need to eat a variety of nutrients to remain healthy and lose w
        30% to be proteins, and the last 30% to be fats. For your weight loss jo
        </p>
        <p>
        Proteins: 3 calories<br>Carbohydrates: 4 calories<br>Fats: 3 calories
        </p>
</body>
</html>
carrunategui@cs:~$
```

OPTIONAL: copy outputfile.html into htmlviewer to view HTML code in web page.

The following is a bash script we created to manage directories and files as well as execute Linux commands.

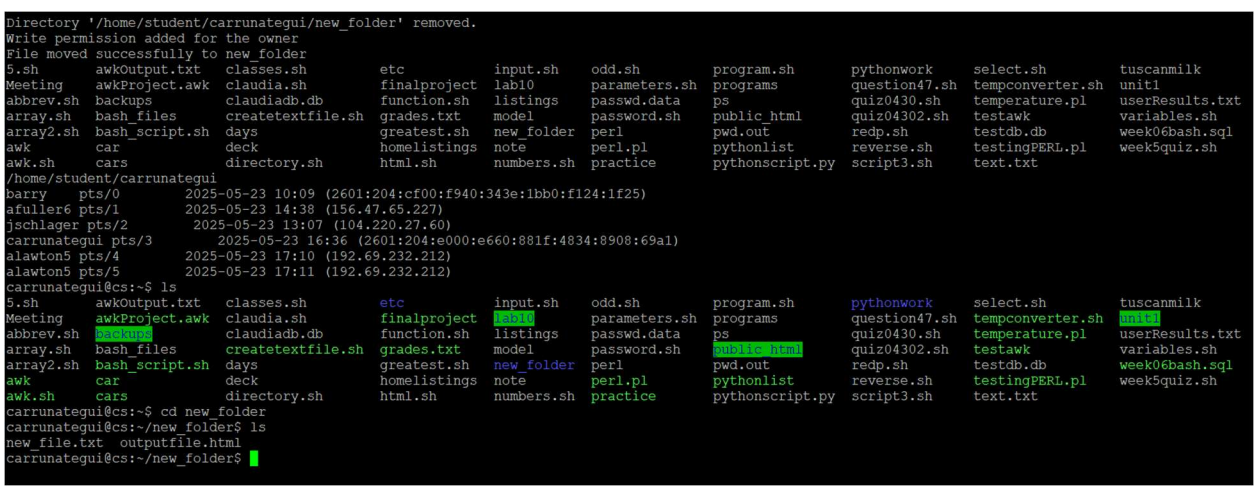
The script goes through the following steps:

- It clears the bash shell screen
- It creates a new text file called “new_file.txt” and it adds two lines of text to the file
- It checks it the folder “new_folder” exists; if it does, then it will remove it
- It updates the permissions of the file “new_file.txt”
- It adds a new folder to the current directory called “new_folder”
- It moves the file “new_file.txt” to the new folder created above
- It moves the “outputfile.html” file that was created when running the scripts for our weight loss calculator to the “new_folder” folder created
- It lists the contents of the current working directory
- It spells out the current working directory
- It displays who is currently logged in

Create bash script by following these steps:

1. Vim bash_script.sh
2. Copy contents from text file “**bash_script.txt**” file
3. Chmod +x **bash_script.sh**
4. Run the bash script: **./bash_script.sh**

Please see below screenshot of bash script:



```
Directory '/home/student/carrunategui/new_folder' removed.
Write permission added for the owner
File moved successfully to new_folder
5.sh       awkOutput.txt   classes.sh         etc           input.sh    odd.sh         program.sh       pythonwork     select.sh         tuscanmilk
